

Mapping process metrics to KPIs to Objective and Goals to produce meaningful management information.

Reporting & Dashboarding - Case Study

Company Major Bank
Project Dashboarding & Reporting
Year 2014/2015
Consultant Jackie Evers

The Business Challenge

One of South Africa’s largest financial services groups was frustrated by a lack of good management information from their IT Service Management function. There was a lack of structure, no consolidated approach or clear reporting framework.

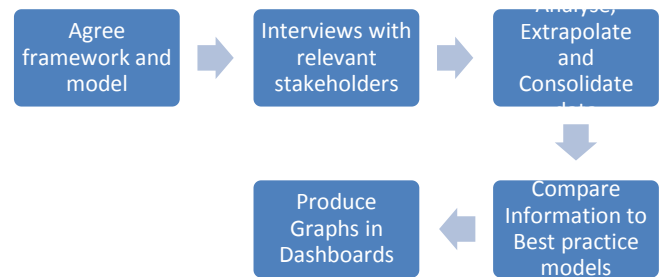

There was also a lack of alignment of metrics to KPIs to objectives and goals, thus reflecting a deficit of Information rather than abundance of knowledge. They required the development of IT Service Management process metrics and reports in line with industry best practices and standards.

The Goal

Develop a reporting model based on best practice ITSM process metrics, with a view to developing reports which would:

- Reflect the customer’s experience
- Measure the effectiveness (capability and performance) of the processes
- Produce relevant trending information across the various processes
- Add significant value to owners and managers for decision making purposes

Our Approach

The Solution

We presented graphs and charts in a dashboard for the client to easily see if they are meeting strategic and operational objectives. We provided a model and framework that client could plug and play into various tools.

The Value

Client data was linked to metrics, which were mapped to objectives to show performance against goals. The client’s data was converted into meaningful information for all relevant stakeholders to make better informed decisions faster.
